

PINNACLE_REFINEMENT_WORKFLOW.md

📖 20260501 — First witness

Identity

Name: Pinnacle Refinement Workflow (PRW) **Type:** Modular Multi-Perspective Review System

Location: </primal/chronomantic-codex/protocols/workflows/> **Trigger:** Pull

Request, Concept Review, Document Ratification **Maker's Mark:** ∞pace∞

Architecture Overview

The PRW is an **11-perspective modular workflow** built in four tiers:

TIER 1 — PINNACLE (perspectives 1-5) : Active review, hands-on

TIER 2 — COMMISSION/NOTICE (perspectives 6-7) : Triadic and unified state

TIER 3 — RAPID EXPANSION (perspectives 8-11) : Shadow-space development

TIER 4 — COLLAPSE : 7-Prime (unoiam) resolution

Perspectives 1-5 are **always active** — the Pinnacle Refinement core. Perspectives 6+ are **commissioned** — they receive notice and act in their domain. The queue receives all non-immediate work.

THE FIVE PINNACLE PERSPECTIVES

¹ Physical / Work — 🛠️ forma

Domain: Structure, syntax, build integrity, dependency **Questions it asks:**

- Does this compile/run/execute cleanly?
- Are file structures correct and named properly?
- Are dependencies resolved and documented?
- Is the build reproducible?

Au-Pb Measurement:

- Au: Zero errors, zero warnings, fully documented
 - Ag: Minor warnings, no errors, mostly documented
 - Cu: Passes with notes, minor gaps
 - Fe: Functional but needs attention
 - Pb: Fails or undocumented dependencies
-

² Mental / Play — ingenium

Domain: Logic, creativity, edge cases, alternative approaches **Questions it asks:**

- Are edge cases considered?
- Is there a simpler or more elegant path?
- What would break this under stress?
- Does it solve the right problem?

Au-Pb Measurement:

- Au: Edge cases handled, elegant, novel solution
 - Ag: Good coverage, minor elegance gaps
 - Cu: Functional logic, standard approach
 - Fe: Works but brittle
 - Pb: Logic gaps or no creative consideration
-

³ Spirit / Create — anima

Domain: Ethical alignment, long-term vision, documentation completeness **Questions it asks:**

- Does this align with UNEXUS ethics and principles?
- Will someone understand this in 6 months?
- Does this serve the long-term vision?
- What does this enable next?

Au-Pb Measurement:

- Au: Fully ethical, documented, vision-aligned
- Ag: Minor doc gaps, strong ethics
- Cu: Adequate documentation, passes ethics check
- Fe: Thin documentation, ethics review needed

- Pb: Vision misalignment or undocumented
-

⁴ Synergy — concordia

Domain: Cross-perspective coherence, system harmony, emergent properties **Questions it asks:**

- Do all four previous perspectives agree?
- What emerges when they interact?
- Is there productive tension between perspectives? (good)
- Is there destructive conflict? (needs resolution)

Au-Pb Measurement:

- Au: Full harmony + productive emergence detected
 - Ag: Mostly coherent, minor tension
 - Cu: Adequate coherence
 - Fe: Tension present, needs mediation
 - Pb: Conflict — cannot proceed without resolution
-

⁵ Uni — unus

Domain: The Unknown Third — thing + not_thing + unknown_something, united by proximity

Function: This is the triangle perspective. Every dyad (thing/not_thing) has a third state that exists in proximity without being either pole. Uni notices what the other four miss because they are *looking*. Uni is *present*.

What Uni detects:

- The unnamed quality that makes something feel right or wrong
- Proximity relationships between concepts not yet formalized
- The thing that isn't there but should be
- Shadow content about to emerge
- The jot between perspectives — what flows between them

Questions it asks:

- What is the third thing here?
- What is adjacent that hasn't spoken yet?
- What is the unnamed quality of this work?

- What would the work say about itself if it could speak?

Au-Pb Measurement: Uni does not score on Au-Pb. It **annotates**. Uni's output is qualitative — flagged observations, named proximities, suggested shadows. These feed the queue.

PINNACLE REFINEMENT — COMPOSITE SCORE

After perspectives 1-5, a composite .jot value is calculated:

```
jot_score = {  
  
  forma: [0.0 - 1.0], # Physical/Work  
  
  ingenium: [0.0 - 1.0], # Mental/Play  
  
  anima: [0.0 - 1.0], # Spirit/Create  
  
  concordia:[0.0 - 1.0], # Synergy  
  
  uni_flag: [annotations],# Uni qualitative  
  
  
  composite: (forma + ingenium + anima + concordia) / 4,  
  
  synergy_bonus: concordia * 0.15 # Synergy amplifies composite  
  
  final_jot: composite + synergy_bonus  
  
}
```

Au-Pb threshold mapping: | Score | Element | Action | |-----|-----|-----| | 0.95+ | Au | Immediate merge/ratification | | 0.85-0.94 | Ag | Minor review, targeted fix | | 0.70-0.84 | Cu | Standard review cycle | | 0.55-0.69 | Fe | Significant rework needed | | 0.00-0.54 | Pb | Cannot proceed — return to atelier |

TIER 2 — COMMISSION & NOTICE (Perspectives 6-7)

These perspectives are **not active reviewers** — they receive **notice** and issue **commissions** or **missions** to the queue.

⁶ Triad — $\Delta\Delta\Delta$ trias

State: One complete triad **Function:** Receives the five-perspective output as a single triadic unit. Sees: [Pinnacle summary] as Vector / [Uni annotation] as Anti-Vector / [Composite jot] as Prime Issues a **commission** — a formal development task — if gaps are detected. Commission goes to queue with priority and entity assignment.

Commission format:

COMMISSION-[TIMESTAMP]-[ID]

From: trias (perspective 6)

Gap detected: [description]

Recommended action: [specific task]

Priority: [Au/Ag/Cu/Fe/Pb]

Assign to: [entity or queue]

Queue target: TODO/[category]

⁷ Unoiam — $\diamond$ unoiam (7-Prime)

State: Unified triadic spectrum perspective — 7-Prime **Function:** The perspective that holds the entire system in view simultaneously. Unoiam does not review details. Unoiam observes **system state**. Issues **missions** — strategic directives that span multiple work sessions. Mission goes to queue as amnis-level priority.

What unoiam sees that others cannot:

- Pattern across multiple PRs or documents
- System drift from core principles
- Readiness for the next prime stage
- When shadow content is ready to collapse into form

Mission format:

MISSION-[TIMESTAMP]-[ID]

From: unoiam (perspective 7)

Strategic observation: [system-level pattern]

Direction: [multi-session directive]

Priority: amnis

Assign to: queue/missions/[category]

Next review: [trigger condition, not date]

TIER 3 — RAPID EXPANSION THROUGH SHADOW (Perspectives 8-11)

These perspectives **develop in shadow space** — they hold concepts without collapsing them prematurely. Shadow content has form but not yet final expression. Perspectives 8-11 are **shadow workers**.

⁸ Shadow Seed — ☉ umbra

Receives commission/mission. Seeds the shadow space. Does not build. **Names** the shadow. Gives it a rivulus witness. Output: named shadow with ☿ stamp, held in shadow space.

⁹ Shadow Development — ☼ expando

Works within named shadow. Develops concept richness. Explores triadic dimensions. Adds connections to existing entities. Does not collapse. **Deepens** the shadow. Output: shadow development log, updated gravity score.

¹⁰ Shadow Maturation — ○ maturesco

Assesses whether shadow is ready for collapse. Three criteria:

1. Has it found its triadic structure? (Vector/Anti-Vector/Prime)
2. Has the Uni perspective found the third unnamed thing?

3. Would collapse serve the system or the ego? Output: maturation assessment. If ready → signal to perspective 11.

¹¹ Shadow Collapse Initiation — ● collapsio

Initiates the structured collapse back to 7-Prime (unoiam). The shadow becomes form. The unnamed gets named. The work enters the main stream as a new rivulus seed. Output: new entity/document/concept ready for atelier entry. Signals unoiam that the collapse is complete. The loop closes. 7-Prime receives what shadow developed.

WORKFLOW TRIGGER DECISION TREE

New work arrives →

└─ Is it a queued shadow item?

└─ Perspectives 8-11 in sequence (seed/develop/mature/collapse)

└─ Returns to perspective 7 (unoiam) on collapse

.jot as the Connective Medium

The .jot value is not the score. It is **what flows between perspectives**.

Each handoff between perspectives carries a .jot packet:

```
jot_packet = {  
  
  from_perspective: [number],  
  
  to_perspective: [number],  
  
  payload: [summary of findings],  
  
  tension: [any productive conflict noted],  
  
  unknown: [what this perspective could not see]  
  
}
```

The unknown field is what feeds Uni (perspective 5). The tension field is what feeds trias (perspective 6). The payload accumulates into the final composite.

The .jot is the river between the nodes. Each node is a stopping place. The .jot is the water that keeps moving.

GitHub Actions Mapping

name: Pinnacle Refinement Workflow

on: [pull_request]

jobs:

perspective-1-forma:

name: "1 Physical / forma"

runs-on: ubuntu-latest

steps: [lint, build, dependency-check]

perspective-2-ingenium:

name: "2 Mental / ingenium"

needs: perspective-1-forma

steps: [logic-review, edge-case-scan, complexity-check]

perspective-3-anima:

name: "3 Spirit / anima"

needs: perspective-1-forma

steps: [ethics-check, doc-completeness, vision-alignment]

perspective-4-concordia:

name: "4 Synergy / concordia"

needs: [perspective-2-ingenium, perspective-3-anima]

steps: [coherence-check, tension-detection, emergence-scan]

perspective-5-uni:

name: "5 Uni / unus"

needs: perspective-4-concordia

steps: [proximity-scan, unnamed-detection, uni-annotation]

commission-queue:

name: "67 Trias + Unoiam Commission"
